Alternator for Forklift

Forklift Alternators - A machine utilized to change mechanical energy into electric energy is actually referred to as an alternator. It can perform this function in the form of an electrical current. An AC electrical generator can in essence be referred to as an alternator. Nevertheless, the word is normally utilized to refer to a small, rotating device driven by internal combustion engines. Alternators that are situated in power stations and are powered by steam turbines are known as turbo-alternators. The majority of these devices utilize a rotating magnetic field but every now and then linear alternators are used.

When the magnetic field around a conductor changes, a current is induced inside the conductor and this is how alternators generate their electricity. Normally the rotor, which is actually a rotating magnet, revolves within a stationary set of conductors wound in coils situated on an iron core which is known as the stator. If the field cuts across the conductors, an induced electromagnetic field likewise called EMF is produced as the mechanical input causes the rotor to revolve. This rotating magnetic field generates an AC voltage in the stator windings. Typically, there are 3 sets of stator windings. These physically offset so that the rotating magnetic field produces 3 phase currents, displaced by one-third of a period with respect to each other.

"Brushless" alternators - these make use of brushes and slip rings with a rotor winding or a permanent magnet so as to induce a magnetic field of current. Brushlees AC generators are most often located in larger devices like for instance industrial sized lifting equipment. A rotor magnetic field can be induced by a stationary field winding with moving poles in the rotor. Automotive alternators often use a rotor winding which allows control of the voltage produced by the alternator. It does this by varying the current in the rotor field winding. Permanent magnet devices avoid the loss due to the magnetizing current in the rotor. These devices are limited in size due to the price of the magnet material. The terminal voltage varies with the speed of the generator as the permanent magnet field is constant.
